# Announcing the General Availability of the Azure Arc Gateway for Arc-enabled Kubernetes!

**jalenmcg** MICROSOFT
Mar 03, 2026

We're excited to announce the General Availability of Arc gateway for **Arc-enabled Kubernetes**. Arc gateway dramatically simplifies the network configuration required to use Azure Arc by consolidating outbound connectivity through a small, predictable set of endpoints. For customers operating behind enterprise proxies or firewalls, this means faster onboarding, fewer change requests, and a smoother path to value with Azure Arc.

**What's new:** To Arc-enable a Kubernetes Cluster, customers previously had to allow **18** distinct endpoints. With Arc gateway GA, you can do the same with **just 9,** a 50% reduction that removes friction for security and networking teams.

## Why This Matters

Organizations with strict outbound controls often spend days, or weeks, coordinating approvals for multiple URLs before they can onboard resources to Azure Arc. By consolidating traffic to a smaller set of destinations, Arc gateway:

- **Accelerates onboarding** for Arc-enabled Kubernetes by cutting down the proxy/firewall approvals needed to get started.
- **Simplifies operations** with a consistent, repeatable pattern for routing Arc agent and extension traffic to Azure.

# Automating Windows Server Licensing Benefits with Azure Arc Policy

jpigott MICROSOFT

Dec 22, 2025

## Introduction:

Managing Windows Server benefits licensing across hybrid environments can be challenging. Azure Arc combined with Azure Policy simplifies this by automatically enforcing licensing compliance. This blog explains how the provided policy works and how to deploy it.

## Why implement this policy?

Automating Windows Server Licensing Benefits with Azure Arc Policy ensures that all eligible machines are seamlessly enabled for essential management services, including Azure Update Manager, Best Practice Assessment, Change Tracking, Inventory, and Windows Admin Center integration. For organizations managing hundreds or thousands of servers, manual enablement can be time-consuming and error prone. This policy continuously monitors your environment, automatically identifying newly added machines and highlighting those missing the required benefits, so you can maintain compliance and streamline operations at scale

This learn document detail the benefits available when Windows Server is connected via Azure Arc, especially for machines with Software Assurance or subscription licenses: https://learn.microsoft.com/en-us/azure/azure-arc/servers/windows-server-management-overview?tabs=portal

## Via Script or Policy

### Use Azure Policy to install and manage the Azure Monitor Agent

### Install and manage the Azure Monitor Agent

Summarize this article for me

This article describes the different methods you can use to install, uninstall, update, and configure the Azure Monitor Agent on Azure virtual machines, virtual machine scale sets, and Azure Arc-enabled servers.

#### Prerequisites

For prerequisites and other requirements for using the Azure Monitor Agent, see these articles:

- Azure Monitor Agent supported operating systems and environments
- Azure Monitor Agent requirements
- Azure Monitor Agent network configuration

[Install and Manage the Azure Monitor Agent - Azure Monitor | Microsoft Learn]

### Install and upgrade Azure Monitor Agent on Azure Arc-enabled servers

Summarize this article for me

Azure Monitor Agent is implemented as an Azure virtual machine (VM) extension. You can install Azure Monitor Agent using any of the methods described in Azure Monitor Agent overview.

This article covers installing Azure Monitor Agent on Azure Arc-enabled servers using PowerShell or the Azure CLI. For more information, see Manage Azure Monitor Agent.

#### Use PowerShell

You can install Azure Monitor Agent on Azure virtual machines and on Azure Arc-enabled servers by using `New-AzConnectedMachineExtension`, the PowerShell cmdlet for adding a virtual machine extension.

[Install and Upgrade Azure Monitor Agent on Azure Arc-enabled Servers - Azure Network Watcher | Microsoft Learn]

This article covers how to deploy and configure the Azure Monitor Ag
Policy using a custom policy definition. Using Azure Policy ensures th
enabled servers and that the AMA is automatically installed on newly added Arc resources.

Deploying the Azure Monitor Agent through a custom Policy definition involves two main steps:

- Selecting an existing or creating a new Data Collection Rule (DCR)
- Creating and deploying the policy definition

In order for Azure Monitor to work on a machine, it needs to be associated with a Data Collection Rule (DCR). You include the resource ID of the DCR when you create your policy definition.

[How to deploy and configure Azure Monitor Agent using Azure Policy - Azure Arc | Microsoft Learn]

# LAW vs AMW

Log Analytics Workspace (LAW)

- Application / Container logs
- AKS & VM diagnostic logs
- Audit and security logs
- Azure Sentinel / Defender for Cloud
- KQL-based queries and alerts

Azure Monitor Workspace (AMW)

- Azure Managed Prometheus (AKS metrics)
- VM performance metrics (CPU, memory)
- Container Insights (metrics part)
- Grafana dashboards & alerts

# Workbooks PowerBI Dashboards

AZURE ARC BLOG  2 MIN READ

# Azure Arc for Servers Monitoring Workbook

**elan_shudnow** MICROSOFT
May 03, 2022

Azure Arc-enabled servers lets you manage Windows and Linux physical servers and virtual machines hosted *outside* of Azure, on your corporate network, or other cloud provider. This management experience is designed to be consistent with how you manage native Azure virtual machines, using standard Azure constructs such as Azure Policy and applying tags.

Azure Monitor Workbooks provide a flexible canvas for data analysis and the creation of rich visual reports within the Azure portal. They allow you to tap into multiple data sources from across Azure, and combine them into unified interactive experiences.

A new Azure Arc for Servers workbook has been created in the microsoft/AzureMonitorCommunity public GitHub Repository.  A direct link to the new workbook is available here.

In this article, we'll walk through the four tabs currently available in the first release of this new workbook:

- **Overview** - Provides an overview of information regarding Arc-enabled Servers including a list of servers discovered and information regarding those servers, a map of where your Arc-enabled Servers exist in the World based on the Server's Source IP, Installed Extensions and what Workgroup or Domain the Arc-enabled Servers belong to.
- **Server Health** - Provides Server Health for your Arc-enabled Servers.  This includes what servers are Offline (Disconnected), have an Error, or are Expired. This Tab also includes information around Low Disk Space and Available Agent Updates.
- **Extension Health** - Provides Extension Health for your Arc-Enabled Servers.  This includes what Extensions are in a Failed Status, what Extensions have been automatically upgraded and what Extensions have Automatic Upgrades Disabled.
- **Security** - Provides Advisor Advisor recommendations for Arc-Enabled Servers.  Filter between High, Medium and Low security recommendations.

Azure Arc for Servers Monitoring Workbook | Microsoft Community Hub

# Arc Deployment by GPO

Arc GPO Deployment project contains the necessary files to onboard Non Azure machines to Azure Arc automatically, using a GPO

The project also contains Azure Workbooks to keep track of the onboarding process.

## Content

- DeployGPO.ps1: PowerShell script to deploy the GPO in a certain AD domain
- EnableAzureArc.ps1: PowerShell script that has to be placed in the network share and will execute the onboarding process.
- RenewSPSecretDPAPI.ps1: This PowerShell script securely stores the renewed secret in an encrypted file within the Arc Onboarding share.
- ParseArcOnboardingPrerequisites.ps1: PowerShell scripts that parses the information of the machines that didn't meet the onboard requirements.
- ArcGPO: Folder structure that contains the GPO settings to be imported in AD
- ARMTemplates: Folder with Azure Function Template to monitor Azure Arc Agent version updates.
- Workbooks: Folder with Azure Workbooks to monitor your Azure Arc onboarding Status and your Azure Arc Servers
- ScheduledTask: Folder with a scheduled task that can, programmatically, upload on-prem XMLs report files to Azure Log Analytics

AZURE ARCHITECTURE BLOG 3 MIN READ

# Azure Local LENS workbook—deep insights at scale, in minutes

Neil_Bird MICROSOFT
Jan 30, 2026

A new, community-driven Azure workbook that provides insights into the status, compliance and trends of large Azure Local fleets—fast.

## Azure Local at scale needs fleet-level visibility

As Azure Local deployments grow from a handful of instances to hundreds (*or even thousands*), the operational questions change. You're no longer troubleshooting a single environment—you're looking for patterns across your entire fleet: Which sites are trending with a specific health issue? Where are workload deployments increasing over time, do we have enough capacity available? Which clusters are outliers compared to the rest?

Today we're sharing **Azure Local LENS**: a **free**, community-driven Azure Workbook designed to help you gain deep insights across a large Azure Local fleet—quickly and consistently—so you can move from reactive troubleshooting to proactive operations.

**Get the workbook and step-by-step instructions to deploy it here:** https://aka.ms/AzureLocalLENS

# Azure Arc Benefits Dashboard v2

This folder contains an Azure Workbook template that provides a native Azure Portal experience for tracking both **Azure Arc-enabled server** and **SQL Server Arc** benefits.

## Version History

- **v2.0 (Current)**: Includes SQL Server Arc capabilities, cost toggle, improved UI with radio button navigation, and collapsible notes sections
- **v1.0 (Archived)**: Original Windows Arc-only version available as `arc-benefits-workbook-v1-archive.json` and git tag `v1.0`

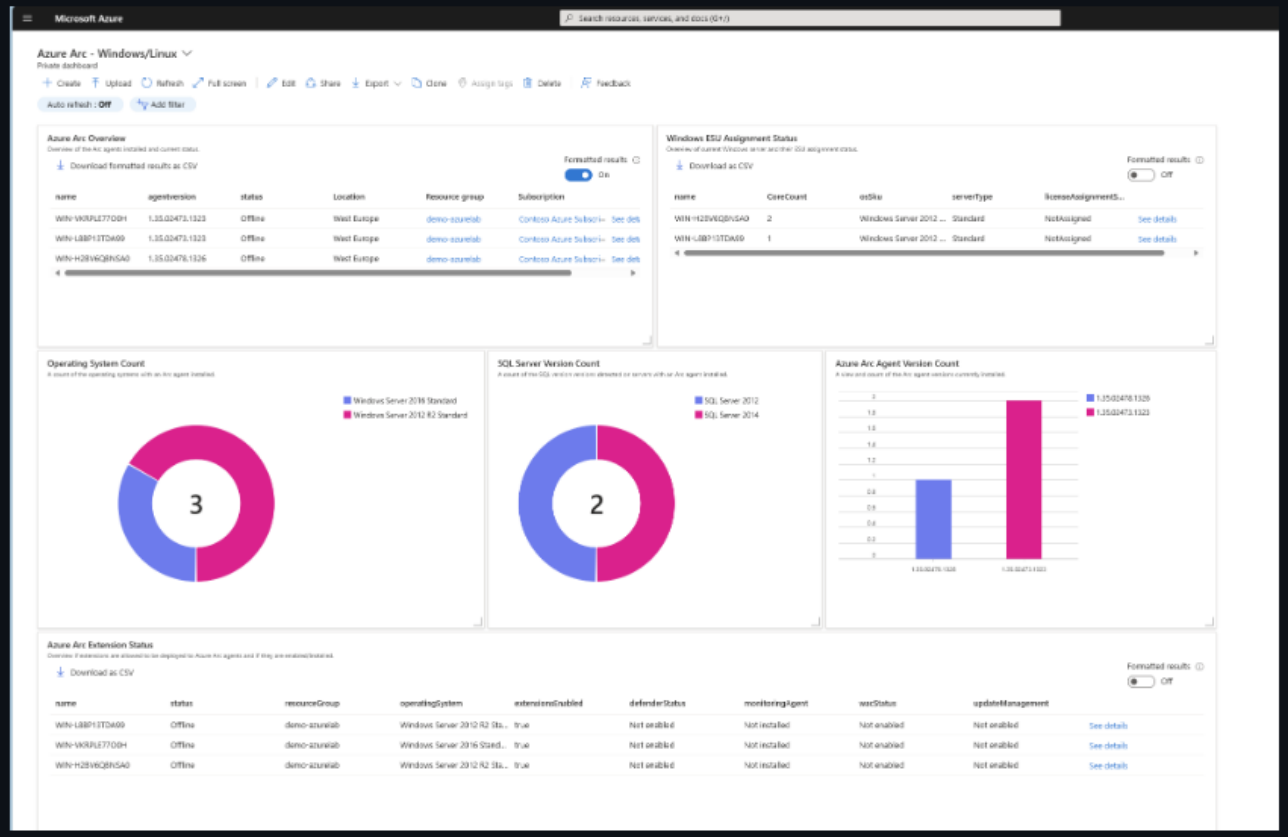
weeyin83/Azure-Arc-Windows-Linux-Dashboard: An Azure dashboard to enable you to view several elements of the Windows or Linux servers you have deployed the Azure Arc agent to in one simple view.

# Azure Arc Windows/Linux Dashboard

This dashboard has been created to enable you to view several elements of the Windows or Linux servers you have deployed the Azure Arc agent to in one simple view. Within this dashboard you will be able to see:

- The Windows/Linux servers that have the Arc agent installed
- A count of what operating systems are being used by these Arc enabled servers
- A view of what Arc agent version is installed
- A count of any SQL instances that have been detected on the servers with Arc agents installed
- Current Windows ESU assignment status
- An overview of whether the Azure Arc is allowed to enable extensions or not. And the status of some of the extensions if they are allowed to be used.



If you'd like to see what Azure Resource Graph queries are used to create this dashboard, you can check out the documentation here.

mm-gh-01/azure-arc-dashboard

# Adaptive Cloud Situational Awareness Dashboard

Welcome to the Adaptive Cloud Situational Awareness Dashboard repository. This project aims to provide a ready to try PowerBI dashboard for a consolidated view of your Azure-native and Arc-enabled operating systems (Windows and Linux) and SQL databases (IaaS and PaaS) estate.

The dashboard consists of a single PowerBI template file (ArcDashboard.pbit) and an auxiliary metadata enrichment Excel file (ProductLifecycle.xlsx). The data is retrieved using the built-in PowerBI Azure Resource Graph connector and three KQL queries.

## Contents

In this file, you will find:

- Dashboard sample screens
- Installation instructions
- Enrichment metadata maintenance
- KQL data source queries

## Sample screens

In the sections below you will find sample dashboard screens populated with test environment data.

### Operating system and SQL Server estate

A unified view of all Arc-enabled servers (on-premises and other clouds) and Azure-native virtual machines.
