Features and improvements in 2601

The January 2026 release of hyperconverged deployments of Azure Local is version **12.2601.1002.38**. For more information, see Release information summary. This release includes various reliability improvements and other bug fixes.

- **OS changes**:
  - In 2601 release, all the new and existing deployments of Azure Local run the new OS version **26100.32230** (download from the Azure portal).
  - You also need a driver that's compatible with OS version **26100.32230** or Windows Server 2025.
  - For Integrated System or Premier solution hardware from the Azure Local Catalog, the OS is preinstalled. Work with your Original Equipment Manufacturer (OEM) to get a compatible OS image and a compatible driver.
- **.NET updates**: This build uses .NET version **8.0.22** for both .NET Runtime and ASP.NET Core. For more information, see Download .NET 8.0.
- **Infrastructure logical network surfaced in Azure portal**: The infrastructure logical network created during Azure Local deployment is now visible in the Azure portal. This visibility allows administrators to review the infrastructure network configuration. This change also acts as a safeguard against accidental workload provisioning on the network reserved for Azure Local infrastructure.

  For more information, see About infrastructure logical network for Azure Local VMs.
- **VM Connect for Azure Local VMs (Preview)**: Starting with 2601 release, you can connect to Windows and Linux based Azure Local VMs that don't have network connectivity or have boot failures.

  For more information, see VM Connect for Azure Local VMs.
- **Unique ID for data disks**: In 2601 release, you can identify data disks on your Azure Local instance with a new property called **Unique ID**. The unique ID matches the `UniqueId` of the data disk (`Get-Disk | Select-Object UniqueId`).
- **Rack aware clustering General Availability (GA)**: Rack aware clustering is now generally available. This feature allows you to define local availability zones based on physical racks in your datacenter, enhancing the resilience of your cluster against rack-level failures.

  For more information, see Rack aware clustering.
- **Diagnostics log collection in Azure portal**: You can now collect diagnostics logs directly from the Azure portal to help with support investigations. This eliminates the need to manually gather logs from individual nodes.
- **Drift detection for Azure PowerShell modules and Azure Command-line Interface (CLI)**: This release adds the Drift Detection framework, enabling Azure Local to continuously validate component level state against the baseline of approved component versions and configurations. The system detects version mismatches during both deployment and runtime by comparing installed component metadata to that of the baseline. Administrators can manually trigger validation using the `Invoke-AzStackHciVSRDriftDetectionValidation` cmdlet to generate detailed

Azure Local 2601 – Highlights

- VM Connect for Azure Local VMs (Preview)
- Rack aware clustering General Availability (GA)
- Infrastructure logical network surfaced in Azure portal

Customizable Security Baselines Now in Public Preview for Azure Policy and Machine Configuration

[Public Preview: Audit and Enable Windows Recovery Environment (WinRE) for Azure Arc-enabled Servers | Microsoft Community Hub]

Aurnov_Chattopadhyay MICROSOFT
Oct 20, 2025

We are excited to announce the Public Preview of Azure Policies to audit and enable Windows Recovery Environment (WinRE) for Azure Arc-enabled servers. This helps to deliver on a more resilient Windows Server experience across hybrid environments.

Windows Recovery Environment is a secure, isolated partition that enables diagnostics and repair when a system encounters critical failures – such as a stop error (commonly known as the blue screen of death). WinRE provides a reliable fallback mechanism for mission-critical workloads, allowing IT administrators to recover systems quickly and securely.

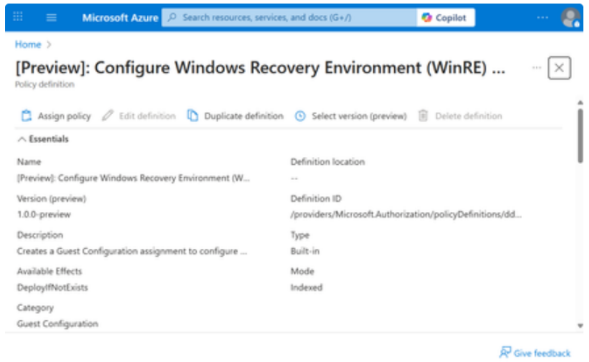
With this Public Preview, Azure Arc introduces a set of Azure Policies that allow organizations to audit and enable WinRE across their fleet of Arc-enabled Windows Servers. These policies are powered by the Machine Configuration component of the Azure Connected Machine agent, which ensures secure and compliant configuration enforcement.

Through the Azure Policy, the Azure Connected Machine agent detects whether WinRE is configured and reports its health status. If WinRE is not configured and the WinRE partition has been provisioned, customers can enable WinRE through the Azure Policy.

These Azure Policies are available at no additional cost for servers covered under:

- Windows Server 2012 Extended Security Updates (ESUs)
- Microsoft Defender for Servers Plan 2
- Windows Server Software Assurance attestation
- Windows Server Pay-as-you-Go licensing

For other servers, these policies will incur charges associated with Azure Machine Configuration.



To get started, deploy and assign these Azure Policies to Azure Arc-enabled servers in your existing subscription.

- [Preview]: Audit Windows machines that do not have Windows Recovery Environment (WinRE) enabled
- [Preview]: Configure Windows Recovery Environment (WinRE) on Windows machines

Auditing and enablement of WinRE through Azure Arc underscores the capability of Azure Arc to increasingly afford resiliency across hybrid, multicloud, and edge workloads.

Ausblick / Roadmap / Preview

Azure Arc Portal Update: Simplifying Onboarding and Management at Scale

MarcoB MICROSOFT
Jan 16, 2026

By Jisu Park | Aaron Woods | George Enninful

Azure Arc extends Azure's powerful capabilities to resources running outside Azure - across on-premises, multi-cloud, and edge environments. The Azure Arc portal acts as the central hub for discovering, onboarding, organizing, and managing these external resources just like native Azure assets.

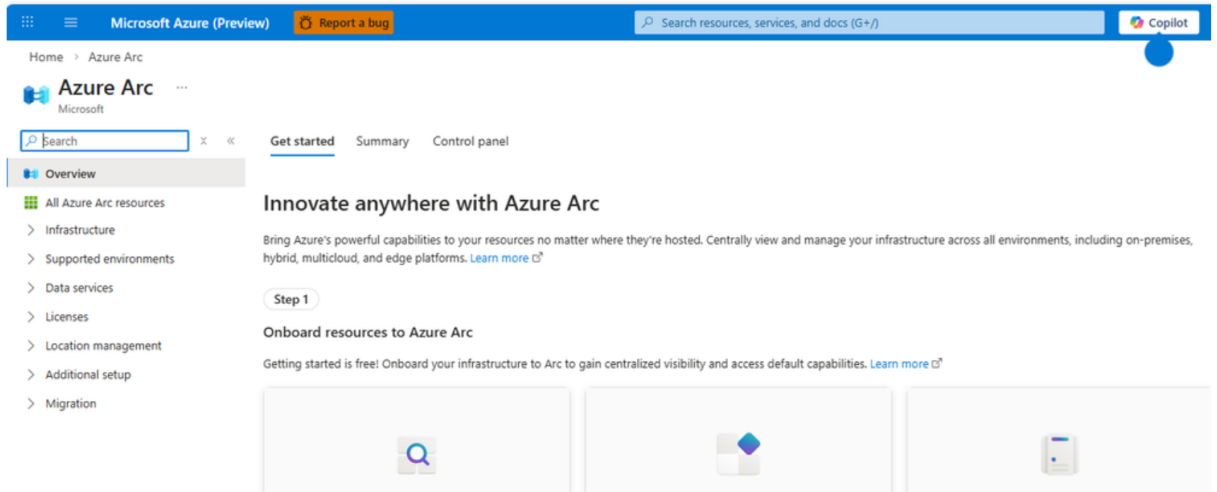
As hybrid and multi-cloud adoption accelerates, we know that simplicity and clarity are critical. That's why we've focused on making the Azure Arc experience more intuitive and actionable. Today, we're excited to introduce a major refresh of the Azure Arc portal, designed to make it easier to get started, onboard resources, and manage your Arc-enabled environments at scale.

What's New in the Azure Arc Portal?

1. **Improved Learnability & Discoverability**

Getting started with Azure Arc used to feel complex because of the wide range of supported resource types and onboarding methods. We've addressed this challenge with a redesigned experience:

- Redesigned Landing Page: The new portal makes onboarding options easier to compare side by side, so you can quickly identify the path that best fits your scenario.
- Guided Onboarding: A short, interactive questionnaire now provides tailored recommendations based on your needs - whether you're onboarding just a few machines or scaling across multiple environments. This creates a more contextual and user-friendly entry point that helps you move from exploration to onboarding with confidence.
- Refreshed Navigation: Based on research into the most common jobs users are trying to accomplish, we reorganized the menu bar into clearer groups. This makes navigation more intuitive and helps you discover key Arc capabilities faster.



[Azure Arc Portal Update: Simplifying Onboarding and Management at Scale | Microsoft Community Hub]

Essential Machine Management preview (EMM)

- At-scale onboarding of management services across Azure VMs and Arc Servers
- Out-of-the-box configuration of services
  - **Monitoring**: VM Insights (metrics-based; DCR & workspace configuration) & Recommended Alerts
  - **Change Tracking & Inventory**: Workspace & DCR configuration
  - **Update Management**: Periodic assessment enabled
  - **Machine Configuration**: Audit security baselines
- Simplified pricing

Public Preview: Auto agent upgrade for Azure Arc-enabled servers

Aurnov_Chattopadhyay MICROSOFT
Aug 12, 2025

Seamlessly keep the Azure Connected Machine agent up to date for the latest server management capabilities and fixes

We are excited to announce the Public Preview of **Auto Agent Upgrade** for Azure Arc-enabled servers. This feature is a major leap forward in simplifying agent lifecycle management across hybrid environments. Once enabled, your Connected Machine agents will automatically upgrade to the latest supported version without requiring manual intervention or scripting.

Benefits of staying on the latest version of the Azure Connected Machine agent include:

- Access to the newest server management capabilities
- Reliability and quality from any bug fixes and agent improvements
- Compliance by getting the latest security fixes and enhancements

Auto Agent Upgrade is built into the Connected Machine agent and can be enabled via Azure CLI or PowerShell by setting the enableAutomaticUpgrade property to true. Once opted in, your agents will be upgraded within one version of the latest release, with rollout batches designed to maintain stability across regions. You can view upgrade status directly in the Azure Portal under the agentUpgrade property. Note that this feature is only available on agents running version 1.48 or greater.

One of the key scenarios is using Auto Agent Upgrade to reduce operational risk and improve consistency across your hybrid estate without the overhead of manual patching. Whether you're managing servers in Azure, on-premises, across other public clouds, or at the edge, this feature ensures you stay on the most current Azure Connected Machine agent version without disrupting your workloads.

To get started with Auto Agent Upgrade on Azure Arc-enabled servers, learn more at Manage and maintain the Azure Connected Machine agent - Azure Arc | Microsoft Learn.

Warum nicht via AUM?

  }
}
PS C:\Users\labadmin>
```

Use always latest versions of CLI & CLI Extensions

→ Update CLI via direct download or WinGet

→ az upgrade for CLI extensions

```
PowerShell 7.5.4
PS C:\Users\labadmin> az version
{
